From the top menu, choose Camera, and browse to your camera. The Adobe Photoshop Elements (Leopard) Camera, Target, and Adjustment Layers Tutorial shows you how to combine multiple layers to blend your photos together. For example, if you are combining a photo with a black-and-white panorama, you can use the Clarity tool and the Clarity adjustment Layer to tone down the edges and bring out some of the details in the background, or use the Dodge tool with an Adjustment Layer to add color to the background. The ability to share links to the photos in your collection makes it easy for you to create social proof for your claims. You can also study the reviewer's comments as an example of the level of skill among the community. Some people appreciate it when photos look great outside the borders of the picture. Try to respond to — if not necessarily agree with — those views, and convey to your readers that working within a given photo is the goal, not having a framed photo. I'm interested to see how Adobe handles the new pricing model. There are a number of unanswered questions, such as what will happen to the old pricing model? Will Adobe assign different license keys to different pricing plans? Will browsers check for license key validation? I'm also curious to see what the impact of Creative Cloud will be on use of the software. Color has always been one of my favorite aspects of this software. If Photoshop was just a basic RAW converter, this would have been probably one of my first choices. It's still a struggle to get the camera to produce perfect highlights and shadows. You're often asked to make keytones more precise. Here's the scene above. In Adobe Camera Raw, you can soft light all 4 corners to bring out detail, and follow that up with a slight adjustment on the highlights to dim them. But underneath the highlights, there is still room for improvement. I've yet to find a way to automate the hell out of this process.
